

## **No need to be a MD, just think about this.**

Did you know the CDC schedule<sup>1</sup> specifies giving all babies the HepB vaccine on the day they are born? I spoke with a Center for Disease Control (CDC) specialist over the phone who explained to me that it is needed because, “should the baby come in contact with infected blood or body fluids it would not be protected.” In practical terms however, the way HepB is transmitted is through dirty needles or coitus, neither of which a baby is subject to. Everyone agrees that vaccines are not 100% safe. Over 21,000 children under 3 have been injured<sup>15</sup> by HepB vaccine alone. The supreme court ruled that vaccines are “unavoidably unsafe”<sup>14</sup>. If the mother tests negative, how can the risk to newborns be justified?

The Engerix-B<sup>®</sup> vaccine contains 250mcg<sup>2</sup> of aluminum adjuvant (to increase the body’s antibody response), 10x the government recommended maximum limit of 25mcg<sup>3</sup>. Injecting aluminum into the (closed) intramuscular/circulatory system of a newborn with an immature immune system and kidney function is likely to cause transmission into the nervous system and brain<sup>4</sup>. This is a very different scenario than exposure to aluminum through the (open) digestive system, where developed kidneys can mostly eliminate it from the body.

Delaying the vaccine until at least 2 years of age should be a no-brainer. Dr. Paul Thomas, M.D. who delays (and sometimes eliminates) vaccines, has an autism rate less than 1/1500 among his 13,000 patients<sup>5</sup>. The USA autistic spectrum average is 1/68 children.<sup>6</sup> Correlation of the increasing number of vaccinations with increasing numbers of autism, food allergies and seizures does not prove causation but it should mean investigation. Clinical trials “proving” vaccine safety monitored infants and children for only 4 days<sup>2</sup> or 5 days<sup>16</sup>. The interactive effects of aluminum, a neurotoxin, with other ingredients was not studied. Pediatricians rely on a small group of doctors in the CDC and AAP. Six countries, Denmark, Finland, Iceland, Norway, Sweden and United Kingdom, do not universally immunize against hepatitis B. Pregnant women are screened and the hepatitis B vaccine is provided only to well-defined risk groups.<sup>7</sup>

There were over 73,000 reported cases of HepB vaccine injury since 1990<sup>8</sup> (2,700/yr). Acute viral hepatitis B averaged 3,000 cases/yr.<sup>9</sup> (2011–2015). As of July 2017, the government has paid out over \$3.4 billion to the vaccine injured.<sup>10</sup> Considering the difficulty of proving cause, this is an extraordinary large sum. Doctors rarely report vaccine injury to the Vaccine Adverse Event Reporting System: <https://vaers.hhs.gov> and most patients don’t know it exists, so there is likely a severe underestimation of injuries.

The safety level of a preventive medicine must be very high, as it is aimed at protecting people against diseases that they may not contract. Most medical school students sign a “First do no harm” Hippocratic Oath statement. Parents and doctors are being intimidated to adhere to the CDC schedule and the CDC is biased because it purchases over \$4 billion dollars of vaccines<sup>12</sup> to distribute under the Vaccines for Children program.

### **The birth plan of pregnant women testing negative for HepB should exclude the newborn HepB vaccination.**

Pediatricians and medical doctors MUST do further investigation and then sign onto: [HepB.info/delayHepB](http://HepB.info/delayHepB) which states: Given the risks of vaccine injury (over 73,000<sup>8</sup> from HepB) the CDC schedule calling for HepB vaccination of newborns at birth, 1-2 months, and 6-18 months should be amended to be delayed.

A total of 11 vaccines were given in 1983, over 65 in 2018 and currently, 137<sup>13</sup> are in development. At the same time, vaccine exemptions are being removed. Will we lose our rights to decide what can be injected into our bodies and have to abide by the full CDC schedule? We owe it to ourselves and our children to look deeper into information other than what is provided to our doctors by Pharma. Remember how long it took to prove cigarettes are injurious to health? Remember expert doctors encouraging women not to breastfeed?

Hep B was originally designed for IV drug users but it was a small market. To reach a larger market, infants were targeted because they were considered "accessible." The rationale was that by vaccinating all infants, who were not at risk, they would provide passive protection to at-risk groups.

[HepB.info/acip](http://HepB.info/acip) Oct 2016, CDC's Advisory Committee on Immunization Practices (ACIP) voted to remove the permissive language allowing the hepatitis B birth dose to be administered after discharge from the hospital.

- Just like we can't automatically attribute an increase in autism and dietary issues with an increase in vaccines because correlation does not mean causation, so too we cannot automatically attribute a decrease in HepB to newborn vaccinations, perhaps the decreasing rates are due to awareness of dirty needles and unprotected sex. More open-minded, unbiased investigation is needed.
